Section 1 : Coding

1.   Problem Statement

A customer support system is designed to handle incoming requests using a queue. Implement a linked list-based queue where each request is represented by an integer. After processing the requests, remove any duplicate requests to ensure that each request is unique and print the remaining requests.

Input Format

The first line of input consists of an integer N, representing the number of requests to be enqueued.

The second line consists of N space-separated integers, each representing a request.

Output Format

The output prints space-separated integers after removing the duplicate requests.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
2 4 2 7 5

Output: 2 4 7 5

Answer

```c
// You are using GCC
#include<stdio.h>
#include<stdlib.h>
typedef struct node{
    int data;
    struct node*next;
}node;
typedef struct {
    node*front;
    node*rear;
}queue;
void initqueue(queue*q){
    q->front=q->rear=NULL;
}
void enqueue(queue*q,int val){
    node*newnode=(node*)malloc(sizeof(node));
    newnode->data=val;
    newnode->next=NULL;
    if(q->rear==NULL){
        q->front=q->rear=newnode;
    }
    else{
        q->rear->next=newnode;
        q->rear=newnode;
    }
}void removeduplicates(queue*q){
    node*cur=q->front;
    while(cur!=NULL){
```

```c
        node*run=cur;
        while(run->next!=NULL){
            if(run->next->data==cur->data){
                node*duplicate=run->next;
                run->next=run->next->next;
                if(duplicate==q->rear){
                    q->rear=run;
                }
                free(duplicate);
            }else{
                run=run->next;
            }
        }
        cur=cur->next;
    }
}
void displayqueue(queue*q){
    node*temp=q->front;
    while(temp!=NULL){
        printf("%d ",temp->data);
        temp=temp->next;
    }
    printf("\n");
}
int main()
{
    queue q;
    initqueue(&q);
    int n,val;
    scanf("%d",&n);
    for(int i=0;i<n;i++){
        scanf("%d",&val);
        enqueue(&q,val);
    }
    removeduplicates(&q);
    displayqueue(&q);
    return 0;
}
```

2. Problem Statement

Sara builds a linked list-based queue and wants to dequeue and display all positive even numbers in the queue. The numbers are added at the end of the queue.

Help her by writing a program for the same.

Input Format

The first line of input consists of an integer N, representing the number of elements Sara wants to add to the queue.

The second line consists of N space-separated integers, each representing an element to be enqueued.

Output Format

The output prints space-separated the positive even integers from the queue, maintaining the order in which they were enqueued.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
1 2 3 4 5

Output: 2 4

Answer

```c
// You are using GCC
#include<stdio.h>
#include<stdlib.h>
struct Node{
    int data;
    struct Node*next;
};
void enqueue(struct Node**rear,int value){
    struct Node*newNode=(struct Node*)malloc(sizeof(struct Node));
    newNode->data=value;
    newNode->next=NULL;
    if(*rear!=NULL){
        (*rear)->next=newNode;
    }
    *rear=newNode;
}
int dequeue(struct Node**front){
    if(*front ==NULL)return-1;
    struct Node*temp=*front;
    int value=temp->data;
    *front=temp->next;
    free(temp);
    return value;
}
int main(){
    int N,i,num;
    scanf("%d",&N);
    struct Node*front=NULL;
    struct Node*rear=NULL;
```

```
    for(i=0;i<N;i++){
        scanf("%d",&num);
        struct Node*newNode=(struct Node*)malloc(sizeof(struct Node));
        newNode->data=num;
        newNode->next=NULL;
        if(rear==NULL){
            front=rear=newNode;
        }
        else{
            rear->next=newNode;
            rear=newNode;
        }
    }
    struct Node*current=front;
    while(current!=NULL){
        if(current->data>0&&current->data%2==0){
            printf("%d ",current->data);
        }
        current=current->next;
    }
    return 0;
}
```

Status : Correct   *Marks : 10/10*

3. Problem Statement

Manoj is learning data structures and practising queues using linked lists.
His professor gave him a problem to solve. Manoj started solving the
program but could not finish it. So, he is seeking your assistance in solving
it.

The problem is as follows: Implement a queue with a function to find the
Kth element from the end of the queue.

Help Manoj with the program.

Input Format

The first line of input consists of an integer N, representing the number of
elements in the queue.

The second line consists of N space-separated integers, representing the queue elements.

The third line consists of an integer K.

Output Format

The output prints an integer representing the Kth element from the end of the queue.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
2 4 6 7 5
3
Output: 6

Answer

```c
// You are using GCC
#include<stdio.h>
#include<stdlib.h>
typedef struct node{
    int data;
    struct node*next;
}node;
typedef struct{
    node*front;
    node*rear;
}queue;
void initqueue(queue*q){
    q->front=q->rear=NULL;
}
void enqueue(queue*q,int val){
    node*newnode=(node*)malloc(sizeof(node));
    newnode->data=val;
    newnode->next=NULL;
    if(q->rear==NULL){
        q->front=q->rear=newnode;
```

```c
        }
        else{
            q->rear->next=newnode;
            q->rear=newnode;
        }
    }
    int findkthfromend(queue*q,int k){
        node*main=q->front,*ref=q->front;
        int count=0;
        while(count<k){
            if(ref==NULL) return -1;
            ref=ref->next;
            count++;
        }
        while(ref!=NULL){
            main=main->next;
            ref=ref->next;
        }
        return (main!=NULL)?main->data:-1;
    }
    int main(){
        queue q;
        initqueue(&q);
        int n,k,val;
        scanf("%d",&n);
        for(int i=0;i<n;i++){
            scanf("%d",&val);
            enqueue(&q,val);
        }
        scanf("%d",&k);
        int res=findkthfromend(&q,k);
        if(res!=-1){
            printf("%d\n",res);
        }
        else{
            printf("invalid k value\n");
        }
        return 0;
    }
```
